

T-TEK MATERIAL HANDLING, INC. DEPALLETIZING SYSTEMS

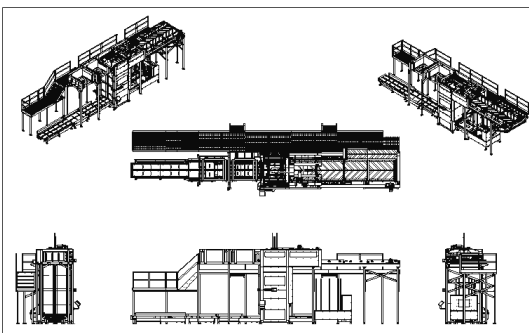

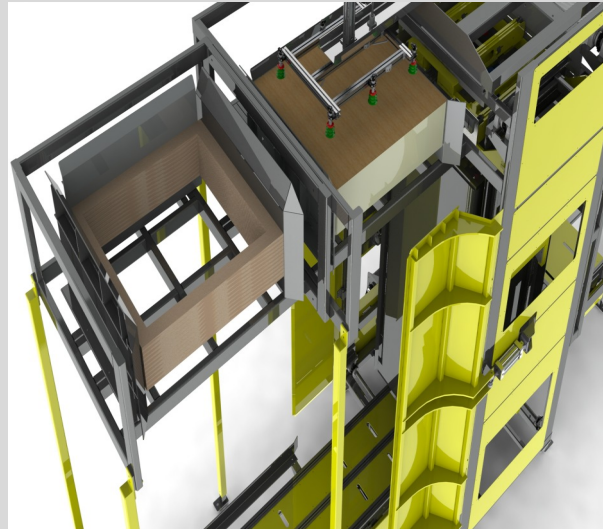

Depalletizing Solutions

T-TEK is now building bulk depalletizers. After successfully upgrading several of our customers existing machines, we have designed and developed a machine to improve your depalletizing operation. We can also supply the downstream single filer, conveyors and system controls.

A few of the features the T-TEK Model DP depalletizer has incorporated into its design:

- Servo driven hoist for soft pallet handling, high speed pallet change out and precise layer positioning.
- Servo driven sweep assembly for high speed layer handling, accurate head to mat speed matching and soft product release.
- An optional servo control on the sweep assembly clamp maximizes bottle stability during layer sweep.
- Tie sheets and frames are distributed into separate or a single common dunnage bin.

The T-TEK Model DP handles glass, plastic & metal containers. Standard machine features:

- Speed: 5-6 sweeps per minute
- Pallet size: 44" x 56"
- Four side containment during transfer
- Touch screen diagnostic controls

Other options such as faster speed or various pallet sizes are available. For more information contact our sales staff.
